INTRODUCTION

This report for WPRI-12/Roger Williams University is based on a telephone survey of a random sample of 407 Rhode Island registered voters.

Interviewing was conducted by telephone (landlines and cell) between July 28 and July 31, 2018. Each completed interview lasted approximately seven and a half minutes.

Interviews were completed only with registered voters in Rhode Island who passed a screen designed to establish their registration.

The following category of respondents were screened out of the survey, and thus not included in the final sample of 407 Rhode Island voters:

- Residents who indicated they were not registered to vote or not sure of their registration status.

SAMPLING

The sample is an area random probability sample of Rhode Island residents; respondents' telephone numbers were selected using a computer generated random sample of Rhode Island registered voters. Sixteen percent of the calls were made to cell phones and 84% to landlines.

(A sampling note: Several symbols are used in the tables of this report to designate groups whose sample size is too small to ensure meaningful results.)

A single + will be found next to all groups whose sample size is less than 70 respondents but at least 50.

Two +'s (++) will be found next to all groups whose sample size is less than 50.

Efforts were made to avoid underrepresenting young voters, a fairly common problem in telephone polls. Interviewers were instructed to ask for the youngest person of voting age presently at home to ensure an adequate sampling of young voters.

Totals may not add up to 100% due to rounding off.

In reading the data in this report and the computer's printouts provided to WPRI-12/Roger Williams University, one should bear in mind that the results are subject to sampling error; that is, the difference between the results obtained from our sample and the results, which would be obtained by surveying the entire adult voting population.

The size of a possible sampling error varies with the percentage of any group given a particular answer, and with the size of each group analyzed; i.e., ALL VOTERS, Men, Women, Democrats, ages 18-39, etc.

The following table outlines the range of error in samples of different sizes and at different percentages of response.

For the overall sample of 407 the sampling margin of error 95 times out of 100 is approximately 4.8%, though slightly lower (4.0%) for responses selected by very high or low percentages of the total sample.

GLOSSARY

Throughout this report, mention will be made of several different groups within the State of Rhode Island. For the reader's benefit, a description is offered below of how these groups have been derived from specific survey questions.
